TI : ELECTRONIC SIGNATURE VERIFYING DEVICE

AB : PURPOSE: To confirm a signature or its validity by performing verification while using the verifying device holding a verifying key and various kinds of information such as user information in place of a document accepted person, and putting its own signature of the verifying device to the verified result.

CONSTITUTION: Holding parts 21-24 respectively hold the user verifying keys, user personal information, user mutual relation information and document information. When a signed document is inputted from a signed document input part 11, a user ID/document type identifying part 12a extracts the user ID of each signing person and the type of that document, a signature verifying part 13 and a signature authority verifying part 14b extract the required user verifying key, user personal information, user mutual relation information and document information from the holding parts 21-24, and the verification of the signature and the verification of signature authority is performed. A signature part 16 puts its own signature of the verifying device held in a verifying device signature holding part 25 to the verified result prepared by a verified result display sentence preparing part 15b, and an output part 17 outputs that result.
